Cost, Effectiveness, and Deployment of Fuel

Economy Technologies for Light-Duty Vehicles

National Research Council 2015-09-28 The light-duty vehicle fleet is expected to undergo

substantial technological changes over the next

several decades. New powertrain designs,

alternative fuels, advanced materials and

significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment

of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway.

What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs,

benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.

Old Stationary Engines D.W. Edgington

2008-03-04 The versatile engine was used a prime mover to drive all kinds of machinery, working either from a fixed stationary position or as a portable- a trolley or truck was used to

transport it to a location where an appliance needed power. They were available in all sizes, from diminutive models used for home-workshop tasks, to large-scale engines for driving agricultural or industrial machinery. David W. Edgington explores the many types and styles of old engine, describing their development from early steam and gas driven examples through to later versions fuelled by petrol, paraffin and diesel. Colour photographs and archive illustrations depict engines produced by well-known manufacturers such as the Associated Manufacturer's Company, Lister, Petter, and

Wolseley, and those of lesser-known markers such as Morton and Naylor. This is the ideal introduction to these fascinating machines.
